Giant Mini Floculent Filtration

A simple and very cost effective approach in the separating and disposal of waste created from the breakdown of deburring media and metal removal.

Waste water gets pumped into the holding tank

Add floculent (1/2 oz per Gal of water)

Mixer the water and the floculent

Floculent attaches to waste particles in the water making the waste particles bigger and heavier allowing them to be separated from the water when the holding tank is drained through the micron bags

Clean water is then pumped back into your system

Waste can be dried and disposed of as a solid

Includes:

- 5 10# micron bags
- 50 lbs of floculent
- 2 recirculating pumps
- 30 gallon mixing tank
- 30 gallon holding tank
